## Important User Information

This section details important user information, directed in particular to new users of WeOS 5:

For help with getting started using WeOS 5, refer to the Quick Start Guide in section 5.

### User Guide

In WeOS 5, the primary user documentation is referred to as the WeOS 5 *User Guide*. Compared to the WeOS 4 *Management Guide*, the User Guide is a web first publication focusing on use-cases, documented in stand-alone "HowTo:s", and configuration guides for all supported sub-systems.

The User Guide is included in the release Zip file in the sub-directory: `doc/weos/user-guide/`. To access the documentation, open the following file in your web browser:

`file://Downloads/WeOS-5.27.1/doc/weos/user-guide/index.html`

The *User Guide* is also available online at `https://docs.westermo.com/weos/weos-5/`.

Copyright © 2026 Westermo Network Technologies AB

# 1  Summary of Changes

This section details new features added in this minor release.

Users new to WeOS 5 are recommended to read section 7 carefully, as it high-lights some of the major differences between WeOS 4 and WeOS 5.

## 1.1  News in 5.27.1

The subsections below describe news in WeOS 5.27.1. In addition, section 2.2 includes information on fixed issues.

### 1.1.1  Hardening Guide

A new *Hardening Guide* section has been added to the *WeOS User Guide* to provide clearer guidance on hardening practices and principles.

### 1.1.2  SCEP handling of no dedicated RA

Now the WeOS SCEP client handles situations when the SCEP server does not provide dedicated RA-certificate(s). For more information see the WeOS User Guide section *Configuration Guides → PKI → SCEP*.

### 1.1.3  New option for outgoing custom telegram instances

It is now possible to configure if a custom telegram should be sent from all devices, that has the custom telegram instance set up, or only from the device that is the active ECSP, i.e., consist master ECSP. The `transmit` option, as it is named, is only available for outgoing custom telegrams when TCN is configured to operational mode `full`. This means that the ECSP functionality is enabled.

## 1.2  News in 5.27.0

The subsections below describe news in WeOS 5.27.0. In addition, section 2.1 includes information on fixed issues.

### 1.2.1  Improved audit-log viewing and pager handling in CLI

The CLI pager and the audit display have been improved to make it easier and safer to inspect long audit logs directly from the device. The key changes are:

- **Exit keys:** It is now possible to exit the interactive pager using `Ctrl-C` or `Enter` in addition to the existing `q` key, making it quicker to return to the prompt.

---

- **Show-all:** A new pager key has been added to display the entire content without paging. When used while viewing the audit, the full audit log will be presented without further pagination.

- **Robustness:** The pager has been refactored to avoid queuing large amounts of fast key presses (for example when a key is held down), which previously could lock the pager for an extended time on console sessions.

In addition, the `show audit` handling has been improved for cases where the interactive pager cannot be used (for example when the terminal window is too small or the CLI is running in non-interactive mode).

### 1.2.2 CLI media context enhancements

The media context in the CLI has been extended with a small set of user commands to make manual control of external media easier. The new commands allow an administrator to eject (unmount) a recognised media definition (optionally forcing the operation), and to mount media that are currently listed as *inactive* or *available* without physically reconnecting the device.

These commands operate only on media definitions known to the boot configuration and do not change the existing access-control or hotplug behaviour. Typical uses include re-mounting media that were intentionally ejected, or recovering from transient mount failures where a device did not automatically mount. For normal operation hotplug will continue to be the recommended mechanism for media mounting.

### 1.2.3 SNMP Trap Hosts via FQDN

SNMP Trap Hosts can now be configured using FQDN instead of only IP addresses.

### 1.2.4 PTP Boundary Clock for Lynx-5xxx, RedFox-5xxx, and RedFox-7xxx

PTP Boundary Clock is now supported on the product series Lynx-5xxx, RedFox-5xxx, and RedFox-7xxx.

For more information see the WeOS User Guide section *Configuration Guides → Network Services → PTP/IEEE 1588*.

### 1.2.5 Mroute entries extended from 128 to 256 and group ranges supported

Mroute entries have been extended from 128 to 256 entries. In addition, it is now possible to configure mroute entries using group ranges.

For more information see the WeOS User Guide section *Configuration Guides → Routing → Multicast Routing*.

### 1.2.6 WireGuard

Support for WireGuard VPN has been added. WireGuard is a modern, fast, and secure VPN protocol designed to be simpler and more performant than traditional VPN solutions like IPsec and OpenVPN. WeOS includes WireGuard support to provide efficient and secure VPN tunnel services.

For more information see the WeOS User Guide section *Configuration Guides → Tunnels and VPN → WireGuard*.

### 1.2.7 SNMP dot1dTpFdb table

SNMP dot1dTpFdb table is now supported. If the same MAC is present in more that one VLAN, it's recommended to use the dot1qTpFdb table because each VLAN will have its own table there.

### 1.2.8 Custom TRDP telegrams

Operational mode-etbn limitations for Custom TRDP telegrams have been removed. Support for aliases in Custom Telegrams has been added. Support for configuring custom telegrams as sent by any device or by only the master consist ECSP has been added for outgoing custom telegrams when opera mode full is used.

## 2  Fixed Issues

### 2.1  WeOS 5.27.0

Fixed issues in WeOS 5.27.0 (as relative to 5.26).

| Issue | Category | Description |
|---|---|---|
| #20859 | FRNT | Long fail-over times when rebooting FRNTv2 member switch |
| #20821 | Alarm | Pre 5.26 configuration for FRNT alarm will incorrectly load "active-low" parameter |
| #20815 | VLAN | Device ignores configuration setting for disabled vlan after reboot |
| #20782 | VPN | IPsec : All ipsec running config dissapears when creating new initiator in WebGUI |
| #20781 | System | Float values are not validated correctly by configuration input validation |
| #20777 | PTP | Retrieving details regarding a specific clock ID, queries all PTP nodes |
| #20776 | PTP | Not possible to set PTP version |
| #20766 | Policy | Policy Traffic Filter edit in webUI changes port |
| #20758 | TCN | IP-TCN instability when system is loaded with SNMP request for TTDP data under certain conditions |
| #20754 | Link Aggregation | Static unicast fdb filters for lags have no effect on Viper 3000 and Lynx 3000 |
| #20736 | System | CPU does not prioritize FRNT management traffic on Redfox and Lynx 5000 |
| #20694 | VPN | IPsec Unable to change Role from Initiator to Responder |
| #20693 | WEB | DHCP-relay webpage does not return errors if validation error occurs |
| #20690 | System | System crash with reboot after multiple hours when running "repeat show logging" |
| #20653 | System | Excuting show FDB over SSH towards Redfox and lynx 5000 devices breaks FRNT ring in special circumstances |
| #20649 | Alarm | Interval is not saved to config file for Trigger types Media and Media-Threshold |
| #20633 | RSTP | SNMP service not responding causes RSTP to storm |
| #20623 | VPN | IPsec : The status box for the IPsec tunnel is always empty |
| #20622 | VPN | IPsec : Web shows different status than CLI |
| #20613 | PTP | Viewing PTP Status in WEB may crash PTP daemon |
| #20595 | System | No audit log message when setting date & time manually |
| | | Continued on next page |

Continued from previous page

| Issue | Category | Description |
|---|---|---|
| #20569 | TCN | comID-131 field etbnRole loses state for not redundant setups after first request |
| #20548 | WEB | Setting password in Encrypted Secrets in WEB doesn't work |
| #20528 | AAA | Downgrade of factory reset device could force the device to enter failsafe mode |
| #20517 | CLI | 'erase' command tab-completion is handled different depending on context |
| #20513 | QoS | Rate limit limits to about half of the value set on egress for Viper-3000 |
| #20507 | QoS | Rate limit on egress does not limit on switchcore 0 |
| #20505 | AAA | Error message 'Could not delete file <cert-name>' appears when importing new pki certificate |
| #20483 | VPN | SSL interface has "(null)" option as cipher in Web |
| #20481 | Logging | show logfile does not generate an audit event |
| #20478 | WEB | Configuring Local User DB doesn't work |
| #20475 | VLAN | FDB entries are not correctly cleared when VLANs are removed |
| #20416 | SNMP | SNMP Read and Write community can not be same as that blocks Write function |
| #20302 | WEB | WEB status for TCN missing most data |
| #20274 | Alarm | Entering the severity command with unknown option will crash clish |
| #20246 | Alarm | Route Monitor doesn't reset the admin distance to the configured value if an alarm triggered |
| #20245 | VPN | IPsec tunnel can be established with wrong PSK in special circumstances |
| #20221 | DHCP | DHCP snooping not limiting to defined VLAN and snoop up all port 67 request |
| #20220 | WEB | Impossible to set peer as a DNS name in SSL client tunnel |
| #20216 | WEB | Cipher cannot be set via WebGUI in the Open VPN settings |
| #20067 | DHCP | DHCP server send out empty option 121/249 fields to clients not requesting the options if set on any static lease |
| #20010 | General | Metrics - Cannot access the web port using IPv6 address |
| #19998 | General | Metrics on ports not working on Dagger Lynx 5512 |
| #19991 | DHCP | Disabling Gateway setting in 'Server-setting' breaks Inherit Gateway in 'Subnet-setting' |

Continued on next page

| Date | Document No |
| February 12, 2026 | 224004-g586110a |

<div align="right">Continued from previous page</div>

| Issue | Category | Description |
|---|---|---|
| #19977 | CLI | Custom SNMP engine-id length is not enforced in CLI configuration |
| #19947 | System | IPv6 SCP not working (copy, upgrade) |
| #19850 | PTP | Different link speeds causes higher TC error rate |
| #19692 | Firewall | TCP port 53 listening when DNS server functionality disabled. |
| #19524 | WEB | Unable to delete VLAN by WEB when FRNT is enabled (Lynx 3000, 5000 and Redfox) |
| #19024 | Link Aggregation | Using link-aggregates as FRNT ring ports gives long failover times in ring topology changes |
| #18808 | Alarm | Link-alarm with multiple ports makes status-relay indicate OK when some port is up and others down |
| #18643 | PTP | RedFox 5528/5728 fiber ports (Eth1-4) have more jitter in the correction field accuracy than the other fiber ports |

## 2.2 WeOS 5.27.1

Fixed issues in WeOS 5.27.1 (as relative to 5.27.0).

| Issue | Category | Description |
|---|---|---|
| 20972 | TCN | Use of custom-trdp-telegrams could cause segmentation error |
| 20927 | WEB | Moving port from deleted VLAN back to another shows error in web |
| 20907 | WEB | The Policy Filtering gets re-enabled automatically for each time the Policy Filtering configuration was changed |
| 20906 | SNMP | SNMP ifIndex-Persistence |
| 20902 | NTP | NTP client can use invalid peer polling interval when setup via DHCP |
| 20897 | System | The system fails to read a valid Policy Traffic Filtering running configuration after a reboot |
| 20892 | Policy | It is not possible to drop 224.0.0.0/24 traffic from reaching the switch CPU |
| 20887 | System | SCEP : an RA-cert with the CA:True flag set is not recognized as RA |
| 20865 | FRNT | FRNT not using TX priority queue 7 on Lynx 5000 and Redfox |
| 20853 | FRNT | Recovering a FRNT ring disturbs other subring/s or the opposite |
| 20779 | System | Metrics process causes high CPU load and affects FRNT ports |

# 3 Known Limitations

This section describes known limitations in WeOS.

## 3.1 Ring Coupling version 2 not supported

Support for FRNT Ring Coupling (RiCo) version 2 was removed in 5.15.0 due to problems with the stability of the function. Most of the use cases for RiCo version 2 can be covered today through the use of FRNTv2 and RiCo v3.

For information around FRNT v2 and RiCo v3 usage please contact local Westermo support.

## 3.2 Port Access Control (IEEE 802.1X and MAC Authentication)

Wake-on-LAN is currently not possible on controlled ports. The reason is that broadcast traffic is not allowed to egress a controlled port until there is at least one MAC address authenticated on the port.

## 3.3 RMON

Some Hardware platforms are unable to provide certain RMON counters due to problems with the hardware chipset.

- RCV Error counter does not work on Viper 3512 and 3520
- FC Received (rx_pause) does not work on Lynx 5000 and Redfox

## 3.4 Login

Known limitations related to the Login service.

**Side-effect of disabling console login**

When disabling login from console, login via telnet is also prohibited (even when telnet login is enabled).

**SSH Public Key Lost When Disabling Built-in User**

WeOS 5.13.0 introduces support for importing SSH public key for built-in users, as well as the ability to enable/disable a user. When disabling a user, the intention is that the user shall be prohibited from logging in, while other user configuration is till kept in the configuration file.

However, the disabling of a user currently implies that any SSH public key associated with the user is removed and needs to be imported again upon enabling the user.

### 3.5 Setting Date Manually

Setting a manual date on the WeOS unit before 1 January 2000 will render an error message.

### 3.6 Available ports for boot specific functionality

The boot loader rescue mode only supports regular copper ports, not SFP ports. On RedFox-5528, ports 1-4 are also not supported until the system has booted.

### 3.7 Routing Hardware Offloading

The routing Hardware Offloading support for Viper-TBN introduced in WeOS 5.8 has shown to have instabilities. In particular, when used with dynamic routing, there are issues not yet solved. Therefore hardware offloading has temporarily been Disabled by default.

```
viper:/#>  configure
viper:/config/#>  ip
viper:/config/ip/#>  offload
viper:/config/ip/#>  leave
```

When Offloading is Enabled, regular IPv4 forwarding is handled in hardware with some exceptions, see the WeOS 5 User Manual for details (section 'Configuration Guides'/'Routing'/'Offloading').

For Redfox and Lynx-5000 initial Offloading support in 5.23.0. Functionality only cover a very small subset of use cases yet and has a list of restrictions.

The Known limitations for offloading on Redfox and Lynx-5000:

- Routed IPv6 traffic is handled by the CPU

- IP multicast traffic will be routed by the CPU

- Firewall forwarding chain will not impact any routed Unicast traffic

- NAT will not be performed on any routed traffic

- Only VLAN interfaces can be used, usage of Port-interfaces will not perform any traffic forwarding

- Policy-Based Routing will not function

- SSL-tunnel will function to some extent via the CPU but is strongly discouraged from being used in this release

Tracking vrrp instances with mroutes is not supported when offloading is enabled. If this feature is used it is recommended to disable offloading. (opposite steps to the example above).

Use of the WeOS Firewall together Hardware Offloading is not supported and the behaviour of doing so is undefined. The exception is when firewall configuration is limited to *filter input* rules.

Hence, if the Firewall is use to configure *filter forwarding* rules, *NAPT* rules or *port forwarding* rules on a Viper-TBN, it is necessary to disable the Hardware Offloading (opposite steps to the example above).

```
viper:/#>  configure
viper:/config/#>  ip
viper:/config/ip/#>  no offload
viper:/config/ip/#>  leave
viper:/#>
```

## 3.8  Redundancy protocols on Relay ports

It is only supported to run link-aggregation as the selected option for redundancy on Relay ports. This is due to the fact that any other protocol can end up in very uncertain situations in cases where the bypass-relays are used.

In the future WeOS may refuse enabling these protocols on relay ports.

## 3.9  FRNT

Fastlink must be enabled manually for FRNT (gigabit Ethernet) ring ports.

Fastlink is a unique feature of Westermo products to optimise gigabit Ethernet link-down fail-over times in layer-2 redundancy protocols such as FRNT.

## 3.10  RSTP

WeOS 5 supports RSTP, compliant to IEEE 802.1D-2004. Due to limitations in the WeOS 4 implementation of RSTP, a WeOS 4 unit will keep ports in blocking mode longer than needed when connected to a WeOS 5 node.

Hence, mixing WeOS 4 and WeOS 5 units in RSTP topologies may exhibit relatively long periods with limited connectivity during topology changes, this applies to both link failure and when a link comes up again.

Link aggregate path-cost use the configured port speed value(s) and not the negotiated speed value. This can lead to RSTP making the non-optimal path selection. Work-around this issue by setting a fixed path-cost in the spanning-tree port configuration.

## 3.11  IEC 61375

In this release, not all of the recovery use cases, nor the optional cases, are supported.

TTDP and non-TTDP multicast can be used simultaneously in this release, but is considered unstable and is strongly recommended to be avoided.

"Automatic Gap Insertions", when several vehicles have the same name, can lead to unexpected behaviour.

When recovery-mode is set to deferred/wait, an ECSC must be running on the configured multicast address. If no ECSC is running and sending data on the configured multicast address, no node will come up at all.

It is strongly recommended to enable inauguration inhibition on all nodes to reduce spurious re-inaugurations and guarantee a stable train communication.

The "ECSP inhibit sync" function should only be enabled in consists with simple or straightforward ECN configurations. In complex configurations with non-symmetric ETBN/ECN connections and/or configurations where different ETBNs are master routers for different ECNs simultaneously, the backup ETBNs will not be able to unambiguously determine which ETBN is the master router/ECSP, which can in turn lead to unexpected behaviour with regards to the local inauguration inhibition value. In these cases, manually setting the local inauguration inhibition values on the backup ETBNs, via the ETBN_CTRL telegram, should instead be performed.

VRRP virtual IP address ("VIP") is primarily intended to be used as a gateway/router address, and not as a host address. However, using the VIP as a host address, that at any one time belongs to the currently active ECSP is a common use case. When using the VIP in this way, for ECSC-ECSP communication, it is recommended that the "vmac" option in the VRRP configuration be turned off for all VRRP instance whose VIPs are used in this way.

### 3.12 Custom TRDP telegrams

The implementation of Custom TRDP telegrams has some limitations:

- The Custom TRDP telegrams feature is only available if the TTDP (IP-TCN) operational mode is either **full** or **off**. It is currently not supported in **etbn-only** mode.

- Data from up to 32 device ports can be included across all defined datasets.

- Data from up to 8 VLANs can be included across all defined datasets.

- Data from up to 4 FRNTv2 rings can be included across all defined datasets. FRNTv2 is the only supported ring protocol for which data can be included.

### 3.13 LLDP

When using Link Aggregation, the individual member ports will transmit LLDP frames using the MAC address of the link aggregation interface, i.e. all member links in an aggregate will be using the same

| Document | |
|---|---|
| Release Notes WeOS 5.27.1 | |
| Date | Document No |
| February 12, 2026 | 224004-g586110a |

MAC address.

## 3.14 Port Monitoring

It is not possible to utilise port monitoring directly on a link aggregation port interface. However it is still fully possible to monitor the individual member ports that constitute any given link aggregate.

Therefore, in order to fully monitor an aggregate, monitoring must be configured for each of the aggregate member ports.

### 3.14.1 Cross switch core limitation

It is not possible to use port-monitor where the source and destination ports are splitt between switchcore 2 and 3 on Viper-120 and Viper-220 products.

Having the source and Destination port on the same switch core or one of the source or destination ports on ports ethX7, ethX8, ethX14 or ethX20 while the other resides on one of the other switchcores is possible.

## 3.15 Media Redundancy Protocol (MRP)

- *MRM not supported for MRP 30 profile:* WeOS 5 units can be configured to operate in MRP 200 or MRP 30 profile. However, for MRP 30 profile, configuring the WeOS 5 unit as MRP Master (MRM) is not supported. A WeOS 5 unit can be used as MRP Client (MRC) with MRP 30 profile with MRMs from other vendors.

  More details: When a link comes up between two MRP clients, the clients send *link-up* messages to the MRP master. The MRP 30 ms profile only gives the MRP master 4 ms to block its secondary port from the time the MRP clients send their first *link-up* message. The WeOS 5 MRP Master is not always capable of doing that, resulting in a short transient loop in the MRP ring when the ring is healed.

  To avoid this, it is recommended to use the MRP 200 ms profile instead. For link-down scenarios, MRP 200 ms profile conducts failover as fast as the 30 ms profile, given that MRCs in the ring are capable of sending MRP *link-down* messages (WeOS units have this capability).

- *Use of MRP with virtual L2 ports (SSL VPN ports):* MRP is specified for use with Ethernet ports (full duplex, 100 Mbit/s or higher). WeOS enables the use of running MRP over SSL L2 VPNs, but requires the VPN to run over a high-performance network to work well. Furthermore, only the MRP '200 profile' can be used with SSL VPNs.

## 3.16 10G SFP Ports

The 10G SFP ports on RedFox-7528 have the following limitations:

---

- IEEE 1588/PTP is currently not supported on 10G SFP ports.

- 10G SFP ports are only to be used for 10G Fiber SFPs, not copper SFPs, 1G Fiber SFPs, or 100 Mbit/s Fiber SFPs.

- Status of MDI/MDIX and polarity shows value 'Invalid' ('N/A' or 'Not Applicable' would be more appropriate).

### 3.17 Search function in User Guide

The User Guide included within the release-zip is Web based. The Search function in the User Guide navigation pane only works if you make the pages available via a Web Server. That is, the Search function does not work when opening the User Guide via your local file system.

At https://docs.westermo.com/weos/weos-5/ you can browse the WeOS 5 User Guide online, with Search function included.

### 3.18 RedBox PTP Boundary Clock

RedBoxes running Boundary Clock in an HSR ring must be connected with all A ports in the same direction. As the BC prioritizes synchronizing from the A port, if two BC are synchronizing towards each other neither of them may end up in a stable state.

Connect devices as shown below:

```
ethA-RB-ethB <-> ethA-RB-ethB <-> ethA-RB-ethB ....
```

### 3.19 Ingress rate limiting

On Viper-3000 series and Lynx-3000 series, ingress rate limiting of multicast traffic includes broadcast.

### 3.20 Policy Traffic Filtering

For Redfox 7000/5000 and Lynx 5000-series, policy traffic filtering counters are not functional for drop filters and are therefore not displayed.

### 3.21 Static unicast MAC filters for link aggregates

Static unicast FDB filters are known to not work as expected when the port associated with the filter is a link aggregate that spans multiple switch cores.

| Document | |

| Release Notes WeOS 5.27.1 | |
| Date | Document No |
| February 12, 2026 | 224004-g586110a |

# 4 Known Issues

## 4.1 List of known issues

| Issue | Category | Description |
|---|---|---|
| #20991 | NTP | NTP client may take one full poll interval to start requesting remote server when starting in larger systems |
| #20976 | Ports | SFP-1100-0818 - 10G-ZR are unable to get link up |
| #20975 | TCN | ECSP status telegram 121 reports wrong status of inhibit after inauguration |
| #20974 | TCN | Backup ECSP fails to generate the TTDB and report 0 consist coupled when the ECSP times out from a coupled consist |
| #20973 | NTP | Missing some documented NTP log messages |
| #20964 | WEB | Session timeout does not work when using multiple browser tabs |
| #20957 | System | Lynx 5000 and Redfox inconsistent hotswap of External media disk without partitions |
| #20954 | AAA | User with role Engineer cannot change configuration. |
| #20953 | System | Sending DSCP priority packets from cpu will use Lowest Priority queue (0) |
| #20947 | VRRP | VRRP preemption do not work in combination with long vrrp-startup-delay causing backup to keep master state |
| #20946 | System | CLI stuck in connection loop for 15+ seconds if no FQDN connectivity in Wireguard peer |
| #20935 | System | Ingress rate limiting unknown unicast also limits known unicast when routing |
| #20919 | General | Certificate store isn't findable by client utilities |
| #20909 | Policy | Trap counter in Policy Filtering does not work |
| #20896 | Any | mDNS discovery not working on Redbox |
| #20894 | WEB | The DHCP option 12 and do not allow FQDN to be set via WEB but is allowed in CLI and according validation schema |
| #20891 | Kernel | Port priority does not work across switchcores (DSA) |
| #20888 | Ports | Redfox and Lynx 5000 SFP handler can fail to setup the correct low level duplex settings for Gbps SFPs |
| #20886 | MRP | EC-62439-2-MIB Do Not Count Up |
| #20868 | System | Ports Eth1-Eth4 on Redfox can become unable to transmit packets after sustained CPU routing overload |
| #20835 | Ports | Port priority can't handle change or reboot |
| #20833 | System | Buffer overflow via crafted input leading to denial of service |
| | | Continued on next page |

| | | Continued from previous page |
|---|---|---|
| **Issue** | **Category** | **Description** |
| #20831 | AAA | IPSec ESP cipher authentication value does not match the CLI/config settings |
| #20828 | System | Deactivating Watchdog in Lynx + RedFox 5000 & 7000 series reboots the unit continuously |
| #20826 | VPN | Dpd timeout treated as constant in schema and not written to strongswan configuration file (only applicable for IKEv1) |
| #20822 | Alarm | Configuring RING alarms from WEB results in wrong acvtive mode (condition) |
| #20820 | WEB | Web becomes unusable when an upgrade was aborted or done without a reboot |
| #20816 | Firewall | Neither input nor forward rules can have "ANY" as interface |
| #20771 | WEB | WEB page is sporadically not updated after configuration |
| #20752 | General | PKI : only first certificate in a bundled visible |
| #20749 | TCN | TCN can fail to build TTDB properly in the extremity 2 backup TBN when cstinfo have same cstID and/or vehID |
| #20748 | System | RMON does not show Filtered/Discarded values |
| #20737 | VRRP | VRRP do not consider vrrp-startup-delay at bootup if another vrrp device is active and spam logfile with bad entries |
| #20733 | Firewall | Port forwarding can not handle other protocols than TCP and UDP |
| #20724 | WEB | Rich is an extended functionality in web and non extended functionality in weos |
| #20712 | TCN | ETBN bypass relay control not working in comID 130 |
| #20703 | VLAN | Incorrect ARP requests sent when bridging LAGs on Redfox and Lynx 5000 |

|---|---|---|
| **Issue** | **Category** | **Description** |
| #18967 | System | Joins on SSL ports does not lead to the CPU port being added to the ATU |
| #18886 | IP Multicast | Static multicast route with wildcard source fails to forward when group first heard on other interface |
| #18675 | Link Aggregation | Long failover time (aggregate member link up/down) in link-aggregate interoperability case (WeOS5 'Dagger' vs WeOS4) |
| #18638 | CLI | CLI does not allow "?" when configuring local user accounts password using clear-text |
| #18614 | TCN | TTDP NAT rules incorrectly modifies packets between local CNs |
| #18362 | TCN | Broken/missing ECSPs in train composition handled incorrectly |
| #18163 | OSPF | Routes to 'redistributed connected E1 routes' lost within NSSA areas upon topology change |
| #18151 | Logging | Long-running programs log events to syslog with the wrong time stamp on timezone changes |
| #18076 | MRP | Probing MRP status (30 ms profile) during heavy load may cause reboot (Viper-TBN) |
| #18069 | QoS | ARP packets treated with lowest priority and may be missed/dropped under load |
| #17995 | System | Service discovery not available in safe-config |

### 4.2 #20888 & #20868 Redfox and Lynx 5000 1Gbps SFP issues

The port will operate in half-duplex mode when using a 1 Gigabit SFP module that is hot plugged into a gigabit SFP slot on Redfox 5000 or Lynx 5000 or when a 1 Gigabit SFP module is used in any SFP+ slot on Redfox 7000. Also note that the port may become unable to transmit frames over that port after sustained device overload until the port is reset.

### 4.3 #18163: Work-around for OSPF NSSAs convergence issue

When using OSPF Not-So-Stubby Areas (NSSAs), failover when a router goes down may take a lot longer time than expected. There are two possible work-arounds until this bug is fixed:

- Alternative 1: Let each router get an address on its loopback interface, and include them in the OSPF area, e.g., use OSPF setting "network 192.168.1.5/32 area 1" for a router in (NSSA) area 1 with address 192.168.1.5/32 assigned to its loopback interface (lo).

- Alternative 2: Use 'regular' OSPF areas instead of NSSA areas.

# 5 Quick Start Guide

WeOS 5 devices are intended to be usable out-of-the-box as a switch. All access ports are assigned to the same VLAN (untagged) and the device tries to acquire a management IP address via DHCP. It also acquires a link-local address (in the 169.254.x.x range). These addresses are advertised with mDNS (Linux/Apple), SSDP (Windows), and LLDP.

## 5.1 Default User and Password

**user:** admin

**password:** admin

## 5.2 General

Apple, Linux, and Windows users with mDNS installed, can either use an mDNS client to find the device's IP address, or connect using a web browser:

- http://weos.local

- http://redfox-4d-3b-20.local

The first example is not available if there are many WeOS devices on the same LAN. The latter, and more reliable address, is a combination of the hostname and the last three octets of the device's MAC address in that LAN. In this example the hostname is `redfox` and the MAC address is `00:07:7c:4d:3b:20`.

Windows users without mDNS have SSDP to discover WeOS devices. In Windows 7 there is the *Network and Sharing Center* where a clickable icon for each discovered WeOS device should appear under *Network Infrastructure*. The PC must, however, be in the same subnet (DHCP or link-local) for this to work. Windows users also have the Westermo WeConfig tool to manage their WeOS devices.

Expert users can also use nmap, a port scanner, to scan the network for the device. Be aware though that this might be frowned upon should your device be located on a shared network.

### 5.3 CLI

WeOS comes with a Command Line Interface (CLI) that can be accessed via a console port at 115200@8N1, or Secure Shell (SSH). Only SSH protocol version 2 is supported. To gain access to the CLI using SSH you need:

- An SSH client, see below

- The device's IP address or DNS/mDNS name, see above

- The user name and password, default user: admin, password: admin

**SSH Clients**

There are many of SSH clients available, some of them can even be used to connect to the devices using a (USB) serial console port. A few free clients are listed below. Please follow the directions for installation and usage applicable to your operating system and client.

**UNIX, Linux, Apple macOS** OpenSSH, `https://www.openssh.com`

**Apple macOS** Termius, `https://www.termius.com`

**Windows** PuTTY, `https://www.chiark.greenend.org.uk/~sgtatham/putty/`

**CLI Overview**

The CLI has two main scopes: admin-exec and configure context. The former is what the user lands in after initial login.

```
redfox-4d-3b-20 login: admin
Password: *****
.--.--.--.-----.-----.------.-----.-.--.--------.-----.
|  |  |  |  -__|__ --|_    _|  -__|  _|  .  .  |  _  | http://www.westermo.com
 \__/\__/|_____._____|  |__|  |_____|__|  |__|__|__|_____|        info@westermo.se
   Robust Industrial Data Communications -- Made Easy

\\/ Westermo WeOS v5.3 5.3.x-g7890bde -- Oct 24 19:30 CEST 2018
Type: 'help' for help with commands, 'exit' to logout or leave a context.

redfox-4d-3b-20:/#> help
```

Central concepts in WeOS are: ports, VLANs, and interfaces. To see status of each in admin-exec context, use `show ports`, `show vlans`, and `show ifaces`.

To change settings, enter the configuration context with the command `config`. The same commands as above also apply here, but now display the configured settings. Notice how the CLI prompt changes to show the current scope.

---

`redfox-4d-3b-20:/config/#>` **iface vlan2**

To show or change the interface and VLAN properties the user enters the command: `iface vlan2` and `vlan 2`, respectively, with an optional "show" as prefix. E.g. `show iface vlan2`.

`redfox-4d-3b-20:/config/iface-vlan2#>` **help inet**

The help command is always available. Use it stand-alone or with a context-specific setting to get more detailed help.

To leave a level use the command `end` to save or `abort` (or Control-D) to cancel. To save and exit all levels, and go back to admin-exec, use `leave` (or Control-Z).

```
redfox-4d-3b-20:/config/iface-vlan2#> leave
Applying configuration.
Configuration activated.  Remember "copy run start" to save to flash (NVRAM).
```

The CLI, unlike the WebUI and WeConfig, has a concept of a running configuration. This is an activated but volatile (RAM only) file that must be saved to built-in flash (non-volatile storage) before rebooting. Many separate config files can be saved, but only one can be the selected startup-config. For details, see the built-in help text for the admin-exec copy and show commands.

# 6 Firmware Upgrade

Firmware upgrade is supported from the CLI, WebUI, and WeConfig tool. The CLI only supports FTP/TFTP upgrade but the WebUI and WeConfig tool can also upgrade via CGI upload – making them the ultimate choice if you have no FTP/TFTP server available or do not care to set one up.

## 6.1 WeOS Image

WeOS devices run from a built-in flash disk and usually comes with three partitions: primary, secondary, and boot. The latter is for the boot loader (see below) and the primary is the main WeOS image partition. Should this ever get corrupted, e.g. due to power-loss during upgrade, the device will boot using an image from the secondary (or backup) partition. This is a very appreciated, but mostly unknown, robustness feature.

```
redfox-4d-3b-20:/#> upgrade primary <SERVER-ADDRESS> WeOS-5.27.1.pkg
```

The system must reboot when upgrading the partition image the system started on. This protects against flash corruption issues seen in earlier releases, caused by simultaneous access to the flash during programming or when starting new processes after an upgrade. Also, WeOS warns when one of the partitions has an image with invalid CRC. Attempting to upgrade the partition with the OK CRC is discouraged, upgrade the partition with the invalid CRC first.

As usual, when upgrading from an earlier release, we always recommend backing up your configuration beforehand.

**Note:** The version string listed in the output from the `show system-information` command in the CLI, or the System Details page in the WebUI, is only updated after reboot.

## 6.2 Boot Loader

The boot loader firmware has its own version numbering scheme and is CPU platform specific. Please note, unless the release notes explicitly recommends it, there is usually no need to upgrade the boot loader.

The boot loader firmware is included in the WeOS-5.27.1.pkg.

- Viper-3000 Series (Coronet): Barebox 2024.03.0-3
- RedFox-5000/7000 and Lynx-5000 Series (Dagger): Barebox 2024.03.0-3
- Lynx-3000 Series (Envoy): Barebox 2024.03.0-3
- Lynx-RB (Byron): Uboot 2024.04.0-1

```
redfox-4d-3b-20:/#> upgrade boot <SERVER-ADDRESS> WeOS-5.27.1.pkg
```

# 7 Significant differences between WeOS 4 and WeOS 5

Some aspects of the CLI are different between WeOS 4 and WeOS 5. Here are some examples:

- Access port names have changed, e.g. `Eth 1` is now `eth1`. Similarly, on products with M12 ports, `Eth X1` is now `ethX1`.

- Port ranges (lists) have changed, e.g. `Eth 1-8` is now `eth1..eth8`

- Server and Internet port settings are now usually input as ADDR:PORT

- IGMP settings have been renamed from `igmp-foo` to `multicast-foo` due to the included MLD snooping support. Hidden compatibility aliases exist to ease the transition

- Stateless NAT (NAT 1-to-1) has moved out from the firewall context

- Enabling management services per interface has moved to each specific service

- Configuration of management services have moved to a separate management sub-context

- New discovery services, in addition to LLDP, are mDNS and SSDP. The latter is for discovery on Windows systems, see also section 5

- The DHCP relay agent CLI syntax has changed considerably

- The `show running-config` command now lists an actual file, in JSON format as mentioned previously. An optional keyword now lists the first level JSON object, and more advanced keywords can also be given in `jq` syntax[1]. For more information, see the CLI online help text for `help running-config`

---

[1]For more information on jq, a JSON query tool, see https://stedolan.github.io/jq/
