SFP Transceivers

ESD Protection
Assemble the Transceiver/s
This instructions show the correct way to assemble the fibre optic transceivers due to the risk of damage that ESD (Electrostatic Discharge) may cause the transceiver and / or the product.

Fibre Optic Transceivers
The transceivers are delivered in an ESD protected box.

Working Area
Use an antistatic surface which is connected to ground and make sure the wrist straps is properly worn and connected.

Assemble the Transceivers
Place the switch on the protected working area with the front facing towards you. Select the right transceiver to assembly, note that it is possible to mix transceivers with different distances in for example one RedFox unit (see the list of transceivers below). Fit the transceiver in to the SFP case and press it carefully until the transceiver clicks in to its position. On the transceivers there is handle in order to remove the transceiver, if the transceiver shall be removed lift the handle towards you. After assembly put the handle in the original position.

Note. Fibre Optic Handling
Fibre optic equipment requires careful handling as the fibre components are very sensitive to dust and dirt. If the fibre is disconnected from the modem, the protective plug on the transmitter/receiver must be replaced. The protective plug must be kept on during transportation. The fibre optic cable must also be protected in the same way. If this recommendation is not followed, it can jeopardise the warranty.
